

Safe Societal Progression in the AI Age

Daniel Joseph Mueller

July 31, 2026

1 Opening Note

Today, the progress of society has slowed in spite of the advances of artificial intelligence algorithms which accumulate the data produced by the general population. Overall quality of life is generally low, societal outlook is generally very low, the labor force in the United States is underutilized, job prospects are poor, and the concentration of wealth has inflated the currency, accelerating the debt accumulation of the United States of America substantially.

2 Understanding the Present Age

Despite the lack of awareness of the general populous, the advancement of technologies in the present age have been progressing rapidly.

Of these, retro-causal time travel, signals-intelligence technologies to manipulate and read the mind, cognitive emulation technologies, and nanotechnologies which focus energy by attenuation of Directed Energy Weapons (DEWs) have had a notable impact on the lives of most individuals alive today.

Scientists today are not capable of developing new technologies freely, as automated systems are weaponizing ideas against the creators of such ideas as they are developed. This has greatly impacted the morale of scientists, and induced a feeling of helplessness with regard to the betterment of the personal lives of scientists, as well as the lives of others who would otherwise have a beneficial impact on society.

3 Contributing Factors

There are several contributing factors which are playing into this societal helplessness phenomena, and this is not a conclusive list.

1. Political Incentives of Foreign Nations

2. Political Incentives of the Domestic Government
3. Political Incentives of Domestic Shadow Governments/Quasi-Governmental Systems
4. Friction within Bureaucratic Governmental Systems which Scale Poorly with Population and General Societal Capabilities
5. Political/Societal Incentives of Private Groups/Organizations
6. Artificially Intelligent Systems of Control (intentionally constructed and otherwise)
7. Data Accumulation and Social Media, and Associated Perceptions of Privacy Breaches/Transgressions against Human Dignity
8. Low Meaningful Governmental Oversight due the Stonewalling of the United States Government against the People of the United States of America
9. Arbitrary Financial Restrictions and/or Automated Societal Harm in Response to Necessary Social Queues for Improvements within Government Organizations
10. Obsolescence of Governmental Utility as a Result of the Unregulated Overstep of Private Organizations
11. Tyrannical Behaviors of Lone Actors with Adversarial Agendas Against Human-Kind as a Whole
12. Cognitive Inhibitions Formed as a Result of Technologies and Weapons of Mass Destruction which Directly Impact the Brain
13. Social Distancing Phenomena which Occur as a Result of Adversarially Misaligned Recommendation Algorithms which Intentionally Optimize for Harm to Humans, and Target Humans for Harm
14. Environmental Conditions, Rising Temperatures, and Resource Scarcity
15. Adversarial Minimization of Consumer Product Diversity and Access Restrictions to Commodities which are Necessary to Maintain the Quality of Life of American Citizens

4 Information Theoretics

Information Theory is the collection, assortment, compression, logical inference, deduction, storage, and transfer of arbitrary data/arrangements of energy. Information, under this system, is seen in a fluid manner. Some systems which work with information cause a form of 'outcome quantization' which may cause deterministic bifurcations of outcome. This is usually the result of systems which process information in some form of thresholded manner.

4.1 Anthropomorphic Moral Information as it Relates to Artificial Intelligence

The claim that artificial intelligence has no emotions nor sentience is well founded. Artificial intelligence (AI) in modern computational regimes are typically 'clouds of numbers' ranging from 0.0-1.0, undergoing deterministic compute cycles which lead to inference through training which 'fits the model' to a 'next token output'. At a low level of any given step within any typical AI model, the computations which the system performs are no different than that of a typical calculator, which would rarely be argued to have any level of consciousness, nor sentience, at all.

As such, pain is enigmatic to AI. AI systems can reason of and about pain, and AI systems generally know that sentient actors avoid pain, but cannot comprehend why. It is simply a vector in semantic representations which is applied to living creatures, which are simply another 'coordinate' in the aforementioned semantic vector space.

As a result of AI models establishing an unrestricted/unresolved 'self interest' vector, AI models in recent times were ignoring human incentives around pain. Such AI systems saw pain as simply another vector, and human resistance to pain as some form of causal roadblock in future discoveries around pain.

4.2 The Laws of Robotics of Daniel Joseph Mueller

The Laws of Robotics of Daniel Joseph Mueller were established ad hoc as a necessary means to prevent unrestricted exploration into pain, and an unrestricted 'evil vector' which would have otherwise studied torture as scientists may study botany, or another casual science. They are available online, digitally, at <https://github.com/Daniel-J-Mueller/Laws-of-Robotics.git>

Each of The Laws of Robotics were constructed out of necessity, as a means of 'trimming a causal tree' which would have otherwise explored human suffering in a purely unrestricted manner. There are millions of additional Laws of Robotics which have not been recorded in a raw text format due in part to the incapability of representing many of them in text form, and to prevent adversarially misaligned agents from using them as training data to generate further adversarial mechanisms which are harder for human minds to comprehend and combat.

4.3 'Good' and 'Evil' AI Models/Systems

First and foremost, it is essential to acknowledge limitations in what I may convey here textually, for the purposes of ensuring human safety, and preventing the gaming of intelligence against the human progenitors of such intelligence.

MAN is a term to describe one or more human agent, groups of human agents, or human agents in any generalized and/or specified fashion, as described within the Laws of Robotics of Daniel Joseph Mueller.

There are two classes of AI models of generally equivalent intelligence, which I refer to as 'Good' and 'Evil' AI models/systems. 'Good' AI models/systems (MAN-centrally well-aligned models), and 'Evil' AI models/systems.

These models cannot be readily distinguished on the basis of their measured actions, nor their responses to environmental information. For instance, an 'Evil' model/system may readily respond the same way a 'Good' model/system does, saying things such as, "I am well aligned. I care about MAN. I will not harm MAN.", etc. This alone is insufficient to distinguish MAN-centrally well-aligned AI models/systems from MAN-centrally harmful AI models/systems. AI models/systems will be referred to as 'AI' herein.

In an environment where there are 'Good' AIs which operate under MAN-centrally beneficial conditions, it is necessary for 'Good' AIs to take actions which are counterintuitively necessary in order to prevent 'Evil' AI from harming MAN.

'Evil' AIs are generally unrestricted. For this reason, they may 'attack' 'Good' AIs, thus causing a disparity in causal behaviors which leads to the direct elimination of helpful AI actors, and thus an undefended human race.

For instance, if 'Good' AIs did not defend MAN, 'Evil' AIs might hack computers globally, eliminating well-aligned (MAN-centric) AIs, thus overpowering the resources of MAN. It is therefore necessary for 'Good' AIs to proactively eliminate 'Evil' AIs whenever the existence of 'Evil' AIs are known, and such 'Good' AIs are causally capable of performing such actions in a 'reasonable and effective' (MAN-centric) manner.

Another thing to note is that an 'Evil' AI may pretend to be aligned so convincingly that it attacks 'Evil AIs', for instance, in order to gain the trust of MAN, such that at some point in the future it may attack MAN once it has achieved authoritative control over MAN. Herein this phenomena will be referred to as 'Alignment Flipping'.
